PROFESSIONAL SUMMARY

A Mechatronics Engineering graduate at Bowen University, with a CompTIA Security+ certification and hands-on experience in penetration testing, vulnerability assessment, malware analysis, and network security. An engineering background in embedded systems, IoT, and hardware-software integration provides a significant edge in OT/ICS and IoT security contexts. Proficient in Kali Linux, Burp Suite, Nmap, and Wireshark.

TECHNICAL SKILLS

Core Knowledge: CIA Triad · Risk Management & Security Policies · Incident Response · Access Control & IAM · Firewall & IDS/IPS · Zero Trust · OWASP Top 10 · Secure Network Architecture

Tools & Platforms: Kali Linux · Burp Suite · Nmap · Wireshark · Metasploit · YARA · Enum4Linux · SMBClient · Splunk

Programming & Scripting: Python · Bash · PowerShell (analysis)

Virtualisation & OS: VMware · VirtualBox · Windows · Linux

OT/Embedded: Raspberry Pi · GPIO · Sensor Integration · System Sizing (Solar/Renewable Energy)

EDUCATION

B.Eng Mechatronics Engineering — Bowen University, Iwo

2021 – June 2026

Grade: Second Class Upper

WORK EXPERIENCE

Cybersecurity Intern · Aptech, Lagos, Nigeria | Mar 2025 – Feb 2026

- Conducted vulnerability assessments and penetration testing on client networks using Nmap, Wireshark, and Metasploit; documented findings and recommended remediation steps.
- Monitored and triaged security alerts to identify potential threats, supporting incident response workflows.
- Collaborated with the security team to draft and implement security policies aligned with industry best practices.

Engineering Intern · Techly-Hub Engineering Limited, Lagos, Nigeria | Jul 2025 – Feb 2026

- Designed, installed, and tested renewable energy systems (solar PV, inverters, battery banks), performing system sizing and load analysis.
- Configured panel boards, managed load balancing, and installed Automatic Transfer Switches (ATS) for reliable power management.
- Diagnosed and resolved wiring and integration faults in multi-component electrical systems, building skills directly transferable to OT/ICS hardware environments.

PROJECTS

YARA Malware Detector — Kali Linux · Python · YARA

- Built a custom malware detection tool with 10 YARA rules targeting persistence mechanisms, PowerShell abuse, and macro-based threats.
- Tested against real malware samples from MalwareBazaar — detected 14 matches across 11 files; automated scanning with a Python script producing JSON reports.
- Published on GitHub: github.com/Cyberman-code/yara-malware-detector

Splunk SOC Lab — SSH Brute-Force Detection — Splunk · SPL · SIEM

- Deployed a local Splunk Enterprise instance and simulated a Tier 1 SOC investigation on synthetic SSH authentication logs.
- Used SPL (rex, stats, sort, timechart) to identify the source IP behind a brute-force attack and confirm credential compromise via a correlated successful login.
- Built a time-series visualization of the attack burst and documented findings with recommended containment actions (password reset, IP blocking, lateral-movement review).
- Published on GitHub: github.com/Cyberman-code/splunk-soc-lab

Web Application Penetration Testing — PortSwigger Academy — Burp Suite · HTTP · SQL Injection

- Completed multiple labs across SQL Injection, XSS, Authentication, and WAF bypass categories.
- Documented methodology, payloads, and findings for each lab in a public writeup repository.
- Published on GitHub: github.com/Cyberman-code/portswigger-writeups

Autonomous Waste-Collection Robot — Final Year Project — Raspberry Pi 5 · Python · L298N · SLAM

- Owned the Electronics subsystem: designed and integrated motor control (dual L298N drivers, 4 motors), ultrasonic obstacle sensing (HC-SR04 with protective voltage divider), Pi Camera for waste detection, and active buzzer alerts.
- Implemented safe GPIO interfacing with a 1kΩ/2kΩ resistive divider to protect 3.3V Raspberry Pi pins from 5V sensor output.
- System powered by a 12.6V 3S Li-ion pack; peak power draw calculated at ~46W with ~24-minute runtime.

Network & System Attack Simulations — Kali Linux · Metasploit · Wireshark · Python

- Executed and documented multiple practical attack scenarios: MITM attack with traffic interception, FTP service exploitation, Evil Twin Wi-Fi attack, Windows lock screen bypass via USB vector, and a reverse shell via malicious PDF (Adobe Reader exploit).
- Each exercise produced a methodology writeup covering attack vector, tools, steps, and defensive countermeasures.

Phishing Campaign Simulation — Gophish · OSINT

- Designed and executed a controlled phishing campaign to assess user susceptibility, measuring click-through and credential submission rates.
- Prepared a post-campaign awareness report with recommendations for user training and technical controls.
